geocapture

Modern access control
Authorisations & access for all doors

Every company is familiar with the problem: Who has which key? Do the employees have the key for the warehouse with them? Does a key have to be reproduced? With geoCapture, you get central management of locking systems with robust RFID technology. Thanks to automatic logging, you always have the access times of all persons in view.

✓ Functions

- Robust RFID key rings
- Locking system (LAN/WLAN/GSM)
- Mobile time recording possible
- Can be used anywhere (mobile network)
- Alerts
- Cloud-based, operation via Internet
- Numerous evaluations

✚ Advantages

- Central management
- Low administrative expenses
- Access protocols per employee
- Access times and authorization levels
- Robust technology
- Maximum mobility via WLAN or mobile network
- Tamper-proof
- Simple operation

RFID technology as a solution

Each employee and other persons requiring access are equipped with RFID key rings. The chip number uniquely identifies the employee. With a few mouse clicks, you determine who is allowed to open which door.

No conventional key is needed to open the door. The employee simply holds the RFID key in front of the locking system and the door opens.
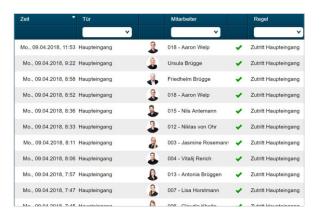

Access control | Publication: 03.04.2019

Automatic protocols

All accesses are automatically logged and can be viewed in the portal. Thereby you receive complete access logs, including employee-related logs.

You can see which employees were on site, at any time- particularly important for protected areas and rooms.

Authorization levels

	Access rules	Doors
—	Exit Assistent	Main entrance
✔	Access main entrance	Main entrance
✔	Access warehouse	
—	Access server	Server room

Access control can be used to conveniently control authorization levels. With geoCapture, access rights are managed flexibly and clearly.

If there are several doors, different authorizations can be assigned for persons who can open certain doors or building sections - per employee or department.

Alerts

The alarm function allows the system to send you notifications when doors are opened. For example, alerts can be sent for each access or attempted access to certain doors or at weekends or at night.

The person responsible is thereby notified immediately by E-mail or SMS.
